## 1.0 Introduction:

Toronto is a well-developed capital city of Canada, with lots of business opportunities and business friendly environment; it has no issue in attracting many different players into the market. However, that also means the market is highly competitive and as a well-developed city, the cost of doing business is also one of the highest in the country. And thus, any new business venture or expansion in the country needs to be reviewed carefully and strategically targeted so that the return on investment will be sustainably reasonable and more importantly the investment can be considerably less riskier.

### 1.1 Problem Description:

This is clearly a problem that a grocery retailer (i.e. BIM Grocery) needs to review and resolve as part of their new business venture in the country. As a startup though well-funded, they need to choose their first starting location in the country carefully for the points highlighted above and more importantly, if this is successful, the location should allow them to replicate the same success fairly quickly; so, first mover advantage is critical for this business and thereby the choice of location (i.e. neighborhood) is also important to them.

### 1.2 Target Audience:

To solve this problem, data scientist team led by myself has been engaged by BIM Grocery. The objective is to locate and recommend to the management which region of the neighborhoods in Toronto will be the best choice to start off their first grocery offering including online capability and delivery services. The management also expects to understand the rationale of the recommendations in the final report.

### 1.3 Success Criteria:

The success criteria of this project will be a good recommendation of the neighborhoods choice to the management of BIM Grocery based on 2 key factors; lack of grocery stores available (less competition) and higher number of residences presented (higher demand) and it should allow easy replication of the business model (similarities among the neighborhoods).

## 2.0 Data Description:

As we need to explore, segment, and cluster the neighborhoods in the city of Toronto, the Toronto neighborhoods data is key for this project. Unfortunately, the data is for the Toronto neighborhood data is not widely available on the Internet in the structured format, hence we need to scrap it through an existing Wikipedia page exists that has all the information we need to explore and cluster the neighborhoods in Toronto. The data should contain the coordinates for each of the neighborhood in Toronto that will help us to further obtaining more information critical for this project. We will also like to obtain the key information like below; such as number of residences

information for each neighborhood which is one of the key factors for the neighborhood of choice in the final report. The data needs to be clean up and eventually in a structured format like the example below.

1. Neighborhood Name
2. Neighborhood Latitude
3. Neighborhood Longitude
4. Number of residences in each neighborhood.

	Neighbourhood	Population	Land Area	Density	Population %	Income	Commuting	2nd Language	2nd Language %	Latitude	Longitude
1	Agincourt	44577	12.45	3580	4.6	25,750	11.1	Cantonese (19.3%)	19.3% Cantonese	43.7854	-79.2785
2	Alderwood	11656	4.94	2360	-4.0	35,239	8.8	Polish (6.2%)	06.2% Polish	43.6017	-79.5452
3	Alexandra Park	4355	0.32	13,609	0.0	19,687	13.8	Cantonese (17.9%)	17.9% Cantonese	43.6508	-79.4043
4	Allenby	2513	0.58	4333	-1.0	245,592	5.2	Russian (1.4%)	01.4% Russian	43.7114	-79.5534
5	Amesbury	17318	3.51	4,934	1.1	27,546	16.4	Spanish (6.1%)	06.1% Spanish	43.7062	-79.4835

## 2.1 Data Features:

We will be leveraging on features in a reliable location information provider such as the Foursquare.com to explore the various types of venues and its categories available in each neighborhood. We will also need to understand the type of these venues nearby (i.e. within 500M) in each of the respective neighborhood. The information obtained per neighborhood will be as such like below and has to be in a structured format so to allow for further computation:

1. Neighborhood
2. Neighborhood Latitude
3. Neighborhood Longitude
4. Venue Name
5. Venue Category
6. Venue Latitude
7. Venue Longitude

	Neighbourhood	Neighbourhood Latitude	Neighbourhood Longitude	Venue	Venue Latitude	Venue Longitude	Venue Category
0	Old East York	43.699971	-79.332520	Mon K Patisserie	43.696922	-79.329520	Pastry Shop
1	Old East York	43.699971	-79.332520	LCBO	43.696728	-79.328875	Liquor Store
2	Old East York	43.699971	-79.332520	Remarks Bar & Grill	43.696726	-79.329219	Pub
3	Old East York	43.699971	-79.332520	Pizza Hut	43.696383	-79.328778	Pizza Place
4	Old East York	43.699971	-79.332520	Taylor Creek Park - West	43.701260	-79.331726	Park
5	Woburn	43.759824	-79.225291	GoodLife Fitness Scarborough Cedarbrae Mall	43.759389	-79.226409	Gym
6	Woburn	43.759824	-79.225291	Shoppers Drug Mart	43.759825	-79.225268	Pharmacy
7	Woburn	43.759824	-79.225291	Staples Cedarbrae	43.759851	-79.228335	Paper / Office Supplies Store
8	Woburn	43.759824	-79.225291	A&W	43.761066	-79.225290	Fast Food Restaurant
9	Woburn	43.759824	-79.225291	Pizza Pizza	43.759321	-79.224929	Pizza Place

### 3.0 Methodology

Data scrapping from the Wikipedia page that contains the up-to-date population statistics of Toronto neighborhoods has been used. This is critical to understand the population of each Toronto neighborhood which is one of the key elements in the neighborhood of choice in this project.

Furthermore, we need to know the coordinates and locations of this neighborhoods, and therefore the geocoder API has been used for achieving this objective. This is important so that we can input this information into the location information provider such as Foursquare.com to obtain venue information in these neighborhoods, and this is precisely what we have done for it in this project.

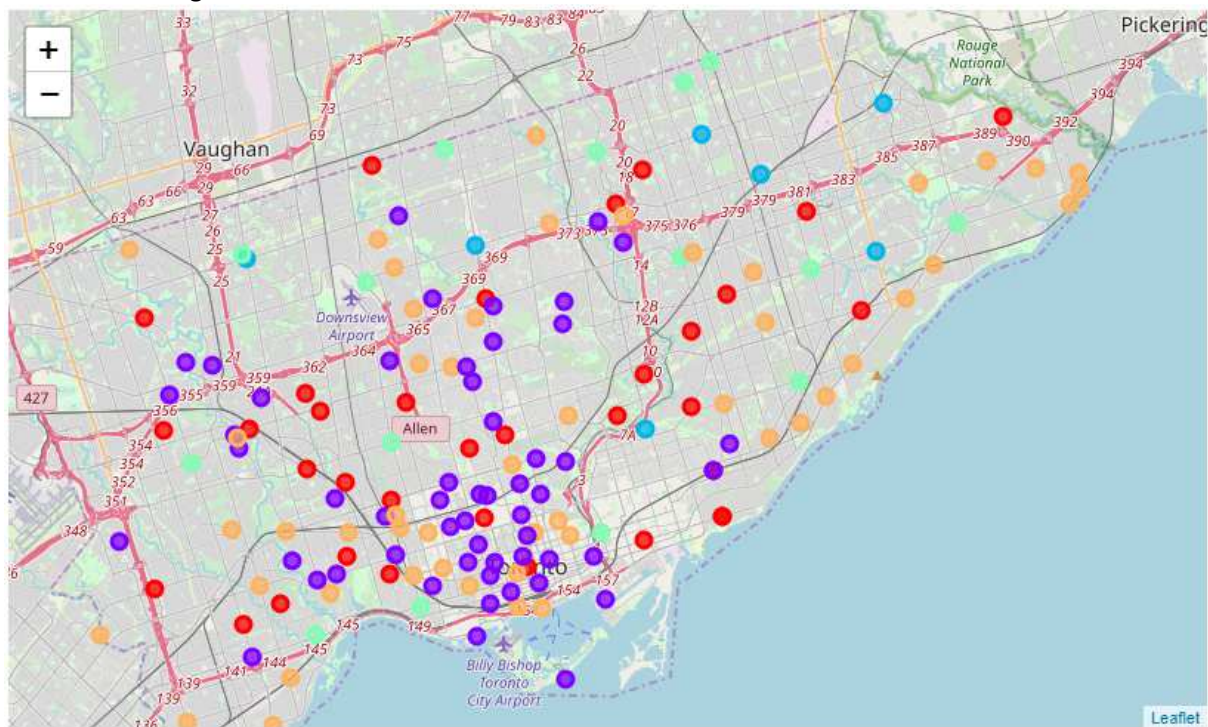

We will also use machine learnings techniques such as the K-Means to segment and cluster these neighborhoods so that we can group them together to understand their similarities. This is critical as

we need to recommend to the management the regions of the neighborhoods of the choice in our recommendation so that BIM Grocery can easily replicate their business model across multiple neighborhoods of similarities easily and quickly as part of their business growth plan.

Finally, with all these methodologies, we will then be able to come up with a best recommendation to the management of BIM Grocery to their problem which is where is the best regions of neighborhoods for them to first start off to offer their services based on neighborhoods similarities, high population and low competition (i.e. fewer grocery stores). In other words, we will not want to recommend to the management to enter a neighborhood whereby there is already a high concentration of grocery stores available and lower demand in the neighborhood.

## 4.0 Result

With K-Means clustering technique, the top 5 clusters of similar neighborhoods have been apparent in the result, see below. These clusters are group together based on the similar nearby venues in each of the neighborhoods. This information is critical so that we can target on the cluster that offer the largest business expansion and growth opportunity as the management of BIM Grocery is interested to replicate their business model fairly quickly upon success in their first service offering in the selected neighborhood.

With bar chart visualization technique, we can easily tell what are the top population (i.e. higher number of residences) in the neighborhood cluster. This is also critical as we will like to recommend to the management of BIM Grocery of the neighborhood with the higher number of population so that there will be a higher demand for their service offering. The top 10 neighborhoods with highest number of populations are as follows :

With Foursquare.com API, we are also able to leverage on the data to find out the top common nearby venues and their categories in each of these neighborhoods. This is critical as we want to recommend a neighborhood whereby the supply is low (lower competition). As shown below, these neighborhoods have fewer grocery choices available giving BIM Grocery a higher advantage and chance to succeed upon entry.

	Neighbourhood	1st Most Common Venue	2nd Most Common Venue	3rd Most Common Venue	4th Most Common Venue	5th Most Common Venue	6th Most Common Venue	7th Most Common Venue	8th Most Common Venue
0	Agincourt	Chinese Restaurant	Asian Restaurant	Korean Restaurant	Hong Kong Restaurant	Vietnamese Restaurant	Butcher	Peking Duck Restaurant	Shopping Mall
1	Alderwood	Pizza Place	Pharmacy	Skating Rink	Gym	Coffee Shop	Pub	Sandwich Place	Pool
2	Alexandra Park	Bar	Furniture / Home Store	Café	Restaurant	Italian Restaurant	Arts & Crafts Store	Vegetarian / Vegan Restaurant	Coffee Shop
3	Allenby	Bookstore	Intersection	Café	Fast Food Restaurant	Restaurant	Big Box Store	Fish & Chips Shop	African Restaurant
4	Amesbury	Intersection	Gas Station	Park	Athletics & Sports	Bank	Coffee Shop	Yoga Studio	Farmers Market

## 5.0 Discussion

Based on the result above, the *first* cluster (i.e. 0) looks to offer a higher number of similar neighborhoods and allow BIM Grocery to replicate their business offering quickly (due to the similarities in these neighborhoods) as part of their growth plan.

Within the *first* cluster, we will like to recommend a neighborhood with higher demand and lower supply to give BIM Grocery a higher advantage and chance to succeed upon their first service offering. Hence, with this in mind, it is apparent that neighborhood **Forest Hill** looks to be the choice as it is the highest populated (i.e. **24 056**) with high income (**101,631**) and very few Grocery stores in the neighborhood (i.e. close to none for the first few most common venues in this neighborhood).

It is also apparent that there is a high number of **Russian** people in that neighborhood and hence, we will also like to encourage the management of BIM Grocery to offer **Russian food** or related supplies in their service offerings in that neighborhood.

## 6.0 Conclusion

With that, we have concluded that the best recommendation for BIM Grocery to first offer their services in Toronto will be neighborhood **Forest Hill** with the key factors to consider such as higher demand, lower competition, easy replication for business expansion. See the recommendation summary below.

1. Region: First Cluster.
2. Neighborhood: **Forest Hill**
3. Additional Offering: **Russian food** or related supplies.

It is also recommended to the management of BIM Grocery to re-run this data science program to get the updated result and use the result into consideration as part of the business growth plan in selecting the next neighborhood to offer their services. This is critical not only to make sure that they got the updated result for better decision making, but also to make sure that they can re-validate the findings from this project. Finally, thank you for the opportunity in this project and we wish you the best success in your business.
